

Sycle Pro with Sycle Noah Sync 4.12.113.0 does not currently fully support the below features and HIMSA has granted certification according to the official waiver provisions provided in the certification policies:

- Noah Alert Dashboard - The dashboard functionality has been partially implemented. It is possible for Alerts to be added to the dashboard but when viewing the dashboard it is only possible to see alerts for the currently selected patient. In the future, it will be possible view alerts for all patients that have an open alert. It is also currently not possible to assign an alert to a Sycle based user account.
- Support for Service Apps - It is possible for a service app to write and read data for patients. Service apps are able to subscribe to receive events but events are not sent. In the future, this will be resolved and implemented.

The business system is required to support these features with their next Noah version upgrade

Additional information about HIMSA's Waiver provisions

HIMSA does occasionally make larger changes to the Noah 4 Engine to either support new features or to stay current with changing technology needs.

As HIMSA makes changes we do understand that there can be a larger impact for business system developers. HIMSA does require that business systems support all Noah Engine features as it is very important to all module and app developers that Noah should work the same, whether the hearing care business is using Noah System or with business system that has integrated with Noah. HIMSA also understands that there may be times where HIMSA has made a mistake or not fully understood the ramifications of a required change and would like to take this time to provide notice to how HIMSA can treat potential issues.
